DETAILED ACTION

Response to Arguments

1. Applicant's arguments with respect to claims 14-21, 23, 28, 30-32 filed on 6/26/2002 have been considered but are moot in view of the new ground(s) of rejection.

Claim Rejections - 35 USC § 112

2. Claims 23 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Claim 14 (line 11) and claim 23 (line 7), both recite the limitation "a storage unit". Is the "storage unit" in claim 23 same with "storage unit" in claim 14 or claim 23 recites a different "storage unit"?

Claim Rejections - 35 USC § 103

- 3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Application/Control Number: 08/962,645

Art Unit: 2612

4. Claims 14-18, 20-21, 23, 28, 30-32 are rejected under 35 U.S.C. 103(a) as being unpatentable over Ohyama et al (US 5,247,330) in view of Saito (US 5,631,699) further in view of Morimura (US 5,940,128) and Ishikawa et al. (US 4,939,580).

Regarding claims 14, 23, Ohyama et al. disclose an image input device comprising an image pickup unit, disclosed as camera unit 2 (figure 1, column 3, lines 1-5); an image pickup direction switch, disclosed as button 12 (figure 1, column 4, lines 34-40). Ohyama et al. disclose a support unit for supporting the camera unit at a predetermined position (predetermined angle). Ohyama et al. disclose mount table as original pedestal 5 in figure 1.

Ohyama et al. fail to specifically disclose an angle detection unit adapted to detect a change of an angle of the image pickup direction. However, Saito teaches an sensor which is provided to a video camera for detecting an orientation position of the video camera (detecting a change of an angle of the image pickup direction, column 8, lines 48-54). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the device in Ohyama et al. by the teaching of Saito in order to detect orientation position of the video camera (angle of the image pickup direction, column 8, lines 48-54).

Ohyama et al. and Saito fail to specifically disclose a control unit adapted to automatically store an image signal in a storage unit. However, Morimura teaches frame memory 5 and 6 which store image signal outputted from video camera 3 (figure 4, column 3, line 65 through column 4, line 16). Therefore, it would have been obvious to one of ordinary skill in the art at the

Application/Control Number: 08/962,645

Art Unit: 2612

time the invention was made to modify the device in Ohyama et al. and Saito by the teaching of Morimura in order to store image signal.

Ohyama et al., Saito and Morimura fail to explicitly disclose storing an image signal including a predetermined angle in a storage unit, in accordance with detecting a change of the image pickup direction by said angle detection unit. However, Ishikawa et al. teaches that image signals are always output except when the camera is moved (video output is inhibited during camera movement, see abstract). This implies that, when the camera is moved from direction 1 to direction 2, it will stop outputting signals while moving, and once it is fixed at new location 2, signals will start to be output again. This shows that the output signal is read when a change has been detected. Therefore, it would have been obvious to modify the device in Ohyama et al., Saito and Morimura by the teaching of Ishikawa et al. in order to only store image signal when a change has been detected. Doing so, it saves the memory of the storage unit.

Regarding claim 15, Ohyama et al. fail to specifically disclose a fixed detection unit adapted to determine whether the image pickup direction is fixed. However, Saito teaches an sensor which is provided to a video camera for detecting an orientation position of the video camera (detecting a change of an angle of the image pickup direction, column 8, lines 48-54). If the orientation of the camera is fixed, this sensor also detect this. Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the device

Page 4

Art Unit: 2612

in Ohyama et al. by the teaching of Saito in order to detect orientation position of the video camera (angle of the image pickup direction, column 8, lines 48-54).

Regarding claim 16, in Ohyama et al., figure 1 shows camera unit 2 which moves in the direction indicated by arrow a (column 4, lines 34-40). Although a moto-type driving means is not explicitly shown, it is considered inherent since the camera moves presumably in response to a user input button 12.

Regarding claim 17, Ohyama et al. disclose the camera unit 2 is capable of moving in the direction indicated by arrow a (column 4, lines 34-40). It would have been obvious to move camera between imaging a document and imaging a person in order to let the user select a desired direction. Images are stores from the camera at all times. Therefore, the time at which the camera changes position from a document to a person is also stored.

Regarding claim 18, Morimura discloses wherein said control unit (microcomputer 17, figure 10) is adapted to cause the stored image signal to be output (figure 10).

Regarding claim 20, Morimura discloses a control unit as microcomputer 17 (figure 10). Morimura discloses that the system stores signals at all times, that inherently includes "image signal stored by the storing means repeatedly".

Art Unit: 2612

Regarding claim 21, Morimura discloses a control unit as microcomputer 17 (figure 10). Morimura discloses that the system stores signals at all times, that inherently includes those times when the camera is located at an angle not equal to the predetermined angle. This shows that "image signal stored by the storing means selectively".

Regarding claim 28, all the limitations are contained in claim 14. Therefore, see Examiner's comment regarding claim 14.

Claim 30 is considered substantively equivalent to claim 18 discussed above.

Claim 31 is considered substantively equivalent to claim 20 discussed above.

Claim 32 is considered substantively equivalent to claim 21 discussed above.

5. Claims 19 is rejected under 35 U.S.C. 103(a) as being unpatentable over Ohyama et al (US 5,247,330) in view of Saito (US 5,631,699), Morimura (US 5,940,128) and Ishikawa et al. (US 4,939,580) further in view of Mizoguchi (EP 617562).

As for claim 19, Ohyama et al, Saito, Morimura and Ishikawa et al. do not explicitly state that the storage means includes more than two storage areas. This implies that two or more frames of image data may be stored in the memory. Mizoguchi also discloses a camera system that stores image data of people or images of events other than people. On page 4, lines 17+,

Application/Control Number: 08/962,645 Page 7

Art Unit: 2612

Mizoguchi states that still image data can be stored as a group of image data. This allows for more than one frame of data to be stored at one time. This allows for more data to be replayed, which is advantageous. For this reason, it would have been obvious to have the storage means in the system of Ohyama et al, Saito, Morimura and Ishikawa et al capable of storing a plurality of frames by being divided into a plurality of storage sections.

Conclusion

6. Any inquiry concerning this communication or earlier communications from the examiner should be directed to **Luong Nguyen** whose telephone number is (703) 308-9297. If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, **Wendy Garber**, can be reach on (703) 305-4929.

Any response to this action should be mailed to:

Commissioner of Patents and Trademarks Washington, D.C. 20231 or faxed to:

(703) 308-6306

or: (703) 308-6296

Hand-delivered responses should be brought to Crystal Park II, 2121 Crystal drive, Arlington, VA., Sixth Floor (Receptionist).
